## What is claimed is:

- 1. A process for continuous production of a water-absorbent resin product, which comprises the following steps of:
- (A) measuring a water-absorbent resin by its predetermined property and/or its predetermined component content, wherein the water-absorbent resin comes being continuously produced via a classification step and/or a surface-modifying step;
- (B) separating a predetermined amount of water-absorbent resin (a) from the water-absorbent resin that comes being continuously produced, wherein the water-absorbent resin (a) is a water-absorbent resin which displays not less than a definite value and/or a water-absorbent resin which displays not more than a definite value as to the predetermined property and/or the predetermined component content in accordance with results of the aforementioned measurement; and
- (C) mixing at least a portion of the aforementioned separated predetermined amount of water-absorbent resin (a) into a water-absorbent resin that comes being continuously produced via a classification step and/or a surface-modifying step on the same or another production line.
- 2. A process for continuous production of a water-absorbent resin product according to claim 1, wherein the mixing in the aforementioned step (C) is carried out on the way of the production line.
  - 3. A process for continuous production of a water-absorbent resin product, which comprises a step (A) of measuring a water-absorbent resin by its predetermined property and/or its predetermined component content, wherein the water-absorbent resin comes being continuously produced via a classification step and/or a surface-modifying step;

with the process involving a change of a production condition in accordance

5

with results of the aforementioned measurement.

- 4. A process for continuous production of a water-absorbent resin product according to claim 1, wherein the aforementioned water-absorbent resin which is measured by its predetermined property and/or its predetermined component content is a water-absorbent resin product that is finally obtained via the surface-modifying step.
- 5. A process for continuous production of a water-absorbent resin product according to claim 1, wherein the aforementioned predetermined property and/or the aforementioned predetermined component content is at least one member selected from the group consisting of absorption capacity without load, absorption capacity under load, liquid permeability, and particle diameters.
- 6. A process for continuous production of a water-absorbent resin product according to claim 5, wherein the aforementioned particle diameters are measured by a laser diffraction scattering method.
- A process for continuous production of a water-absorbent resin product,
  which comprises a step of measuring a water-absorbent resin by its particle diameters,
  wherein the water-absorbent resin comes being continuously produced via a classification step and/or a surface-modifying step;

wherein the aforementioned particle diameters of the water-absorbent resin are measured by a laser diffraction scattering method.

8. A process for continuous production of a water-absorbent resin product according to claim 7, which involves a change of a production condition in accordance with the analyzed particle diameters.

5

9. A water-absorbent resin product, which is a water-absorbent resin product obtained by a process including the steps of: crosslink-polymerizing a monomer including acrylic acid and/or its salt; and then surface-crosslinking the resultant polymer with a dehydration-reactable crosslinking agent;

with the water-absorbent resin product satisfying the following:

- (1) a mass-average particle diameter in the range of 300 to 600 μm;
- (2) a residual monomer content of not higher than 500 ppm;
- (3) an average value of not less than 25 g/g and a standard deviation of 0 to
  0.50 as to an absorption capacity which is measured in a number "n" of analyzed samples = 3 without load;
  - (4) an average value of not less than 20 g/g and a standard deviation of 0 to 0.35 as to an absorption capacity which is measured in a number "n" of analyzed samples = 3 under a load of 1.9 kPa or 4.9 kPa; and
- (5) an average value of less than 5.0 mass % and a standard deviation of 0 to 0.50 as to a fine powder (smaller than 150  $\mu$ m) content which is measured in a number "n" of analyzed samples = 3.
- 10. A water-absorbent resin product according to claim 9, wherein the dehydration-reactable crosslinking agent is a polyhydric alcohol.
